A homemade display just might save the day

he universal hard and fast rule that affects organizations large and small is that marketing budgets are always tight. This was a painful reality in my marketing early days while employed in Wichita's aircraft and healthcare industries. There seemed never to be enough money to buy a nice display to take to a tradeshow, health fair or to loan to the employee club for the local scout roundup. To have either a good floor or table-top display was then, and still is, very expensive; displays are many times very fragile and hard to buy parts for. To have two or more displays for company reps to use was almost always for my employees, completely out of the question.

A marketing department position with Cessna Aircraft in Wichita introduced me to fabricating displays that are attractive, inexpensive, long lasting and easy to make. The Cessna maintenance department made scores of displays designed by the department for reps to use in presentations around the world. The primary material used in these applications is one I still find perfect for display fabrication today – it is Gatorboard.

Gatorboard is an extruded polystyrene foam mounting board encased between layers of a melamine and wood fiber veneer. Gatorboard, sometimes called Gatorfoam, has a harder outer surface than other foam core boards, resists warping and does not dimple under cutting pressure. Gatorboard is more durable than foam core boards and is a good choice for applications where

strength and light weight are important – like fabricating a marketing display.

At my next marketing position with a Wichita hospital, an excellent maintenance department built a half a dozen, three panel, floor displays that were used extensively for the 10 years I

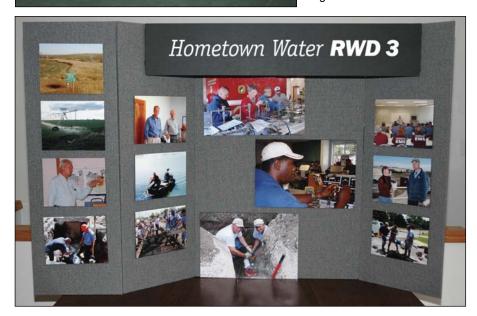

One of the presentations I made frequently to rural chapters was how a small town, small budget, Red Cross chapter manager could afford to make a professional display usable at local events for fundraising, volunteer recruitment or bloodmobiles. Many volunteer chapter managers utilized the

design on the handout and made similar displays that are still in use today.

Left: The 6-panel KRWA homemade display is shown at a past March conference in the Century II EXPO Hall.

Below: This homemade, 4-panel, table-top display costs just over \$200 to make. It is sturdy, attractive, lightweight, flexible to use and will last a long time.

spent in the department. During this same time I was National Rural Chapter Volunteer Chair for the American Red Cross serving southern Kansas and the northern two tiers of Oklahoma counties. Displays used in direct marketing and public relations can be designed to fit specific needs. Lighting, special product mounts and panel configurations can be incorporated into a display design.

Center: After measuring material to cover the 32 in. panel, it was marked with a white grease pencil and cut with scissors.

Right: The 32-in. center display panel is sprayed with 3M Super 77 in a healthy crisscross pattern. The edges were also sprayed at this time. There was a breeze at my back so the overspray was blown away from me. A mask should be worn in less ventilated areas.

My displays are covered with fabrics that accept Velcro hook fasteners used to hold photo images and signage to the display surface.

It wasn't until starting work with KRWA that I had an opportunity to finally fabricate a display myself. Three years ago I designed and constructed the 6-panel, floor display that is currently used in the KRWA booth at KRWA's annual conference in Wichita.

For this *Lifeline* article and a Thursday demonstration class at the March conference, I have made a second display. It is a 4-panel, Gatorboard table-top display. The following steps in the article will provide an overview of materials and techniques to follow in building one of these displays.

Cutting Gatorboard

Gatorboard can either be cut by hand with a utility knife and straight edge, or with a number of power tools. A small table saw was used to cut the half-in., 4 x

8-ft. sheet down to one 32-in. wide panel, and three 16 in. wide panels. A router, jigsaw or Skillsaw could also be used to make the same cuts. The Gatorboard and other materials mentioned are detailed in the 'Materials' sidebar on page 117.

Selecting, cutting and gluing fabric to board

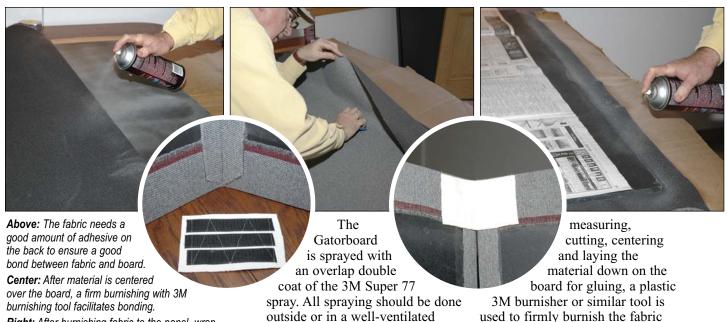

The fabric selected for this project is an upholstery fabric with a rubberized backing that accepts 3M Super 77 spray adhesive quite

well. When selecting a fabric, the fabric surface needs to be rough enough to readily allow Velcro hook fastening material to latch on tight. The 54-in. fabric is then measured to width and cut to let it wrap the Gatorboard edge to cover an additional two inches on the backside of the display panel's vertical edge. This makes a nice edge but also gives the panel fastening system a Velcro grip on the panel edges. This will be shown a little later.

A homemade display . . .

Right: After burnishing fabric to the panel, wraparound material is sprayed along with a masked area on the back of the board where the wrap will glue.

Left circle: Finished and mitered 45 degree angle corners on two panels joined by Velcro hinges sit next to a Velcro hinge. Hinges are made with three strips of 1-in. Velcro hook sewn onto a canvas backing.

Right circle: The hinge's Velcro is gripping two wrapped fabric edges on the back of two panels, holding them together.

The fabric is sprayed with a fairly heavy coat of the 3M 77 adhesive. Having board and fabric surfaces both coated with the 77 spray adhesive ensures a good bond between the two. After

shop or garage. Do not breathe the

overspray! The panel edges must

also be sprayed well at this time.

used to firmly burnish the fabric down, mashing the two glue coatings together. I found that a window ice scraper works just as well. A hard burnishing is also needed on panel edges and panel back wrapped areas. It is important not to forget to spray adhesive on the 2-in. strip along the vertical edges and a little larger spray strip on the back panel ends where the 54-in. length of material wraps each panel end. When finishing the corners on the back wrapped areas, it is easy to fashion and trim a 45 degree miter joint that lays the adjoining sides together that keeps them glued down flat to the board.

Securing the standing panels

To make the one 32-in. and three 16-in. panels stand together they need to be aligned at approximately the angles shown in the first page photo. To secure the standing panels, it is easy to fashion Velcro hinges that affix to the edge joints between panels.

To fabricate the hinge, three 6-in. strips of 1-in. wide Velcro hook tape are sewn onto a canvas backing making a Velcro hinge. (See the inset on the photo above.) Three hinges per panel joint are ample to hold the panels together.

Headers and lights

The header is made of the halfin. Gatorboard and is Velcro fastened at each end to the panel surfaces. Logos, organization names and photos may be fastened to a header for display identification.

An inexpensive, lightweight lamp may be Velcro fastened to the back of a header board to illuminate the center panel. Inexpensive gooseneck lamps can be mounted on outer panel backs as seen in the first page photo of KRWA's 6-panel floor display. Imagination in fabrication and using an affordable contemporary lighting fixture can finish off a homemade display with a professional look of a much more expensive factory built.

The photo mounts seen in the display pictures in the article have been made with a Canon i 9900 photo quality, 8-color ink jet printer. Mounting photos on black foam core material (This is very different from Gatorboard) takes a little practice but is not hard to do. The 3M ATG tape gun seen in the tools picture at right makes this job much easier.

The process takes a few special tools and knowledge of some timesaving techniques but should be explained in more detail, maybe in another magazine article. Examples of photo mounts will be covered more in the display session at the annual conference.

I would encourage anyone who has marketing or public relations duties for their system or community to attend the KRWA annual conference from March 25-27 at Century II in Wichita. The session, "How to Make an Attractive but Inexpensive Display," will be on Thursday, March 27 at 10:45 a.m. in room 203. For more information check the conference registration information in the center section in this issue of Lifeline, or register online at www.krwa.net under "training" and "conference."

Tools, materials and costs

Hand tools and some materials used in the project starting from top left are: 3M Super 77 spray adhesive, 3M Automatic Tape Gun (ATG), rolls of 3/4 in. ATG tape (doubled sided rubber cement tape and ATG gun are used for mounting photos,) Exacto knife and pencils. Front row: T-square, tape measure, metal straight edge, utility knife, 3M plastic burnishing tool, scissors, sandpaper and sandpaper block. Tools are placed on the Burch upholstery fabric. The dark rubber backing on the back of the Burch fabric can be seen at the top of the picture on the fabric roll. This feature helps in the gluing process.

Items purchased for display fabrication

Gatorboard: Black finish, black core, ½"x 4'x 8'

One sheet needed per display and was purchased from Regal Plastic Co., with locations in Wichita

and Kansas, City, Missouri. \$70.00

Burch Interweave Charcoal Upholstery Material:

Three yards are needed. \$105.00
Material was purchased at Allen's
Upholstery, Wichita, Kansas.

3M Super 77 Spray Adhesive:

Two cans are needed. They were purchased at Ace Hardware, Manhattan, Kansas.

\$20.00

Velcro hook adhesive tape:

1 in. wide, x 3 yards roll was purchased at Hobby Lobby, Manhattan, Kansas.

\$6.00

Total display cost

\$201.00
